In-Class Exercise 4:

Creating a Personal Website

For the rest of the day, you'll be working on creating a personal website with three different pages: *index.html, aboutme.html,* and *myfavorites.html.* You'll be embedding images into your web pages, so you'll also need to create an *image* folder for your website.

1. Create a new folder on your desktop and name it *MyWebsite*. Inside of it, create your three HTML pages and your image folder.
2. Index.html- This will be the visitor's landing page. On the page, put:
   a. a title for your page
   b. a welcoming picture
   c. a welcoming quote.
3. About.html- This page will contain a short biography about you. It should contain:
   a. A page heading
   b. A picture of you (be sure the picture is located in the appropriate folder)
   c. Two or three paragraphs about yourself.
4. Myfavorites.html – This page will contain multiple lists of your favorite things. Because this is a long page, **please use a page heading as well as suitable subheadings**. Please include:
   a. A list of your favorite animals, plants, locations, or past times (you only need to include one of these) – Use a definition list for this, and for each term provide a short description of what you like in it.
   b. Your favorite recipe – Please provide instructions for how to prepare it. Use an unordered list for the ingredients, and an ordered list for the step-by-step directions. You may look on the web for inspiration here.
   c. Your favorite images – For the purposes of this class, please find five different images and save them into your *images* folder. Display all five images using an unordered list. Inside each list element, include a <figure>, <img>, and <figcaption> elements.
   d. Your favorite movies – Include four of your favorite movies. Use whatever sort of list you would like. For each movie, include external links to that movie's page on RottenTomatoes, IMDB, and Metacritic.
5. Next, add a navigation section at the top of each page so that you can navigate between them. Your navigation section should allow you to navigate to the follow places: your *index.html* page, your *About.html* page, your *myFavorites.html* page, *and to each list inside your myFavorites.html page using **Fragment Identifier.***
6. Finally, make sure that your pages contain valid, well-formatted, well-structured HTML by running each page through the follow tools:
   a. https://validator.w3.org/#validate_by_input
   b. https://gsnedders.html5.org/outliner/
   c. https://www.freeformatter.com/html-formatter.html
